3rd PERSON VIEW

UNFILTERED VIEW OF
YOUR BEHAVIORAL
BLIND SPOT

WHAT IT IS

3rd Person View is a device that plants a live image directly into your field of vision through a contact lens. At random intervals, a third-person camera appears in a corner of what you see: yourself, from behind, in real time, going about your day.

You cannot close it. You cannot anticipate it. It appears without warning, shows the real situation – what you are doing, how you are doing it, where you are – and disappears. No trace. No demands.

Your habits become undeniable when you watch yourself carrying them out.

It doesn't tell you what you're doing is wrong. It shows you exactly what you're doing.

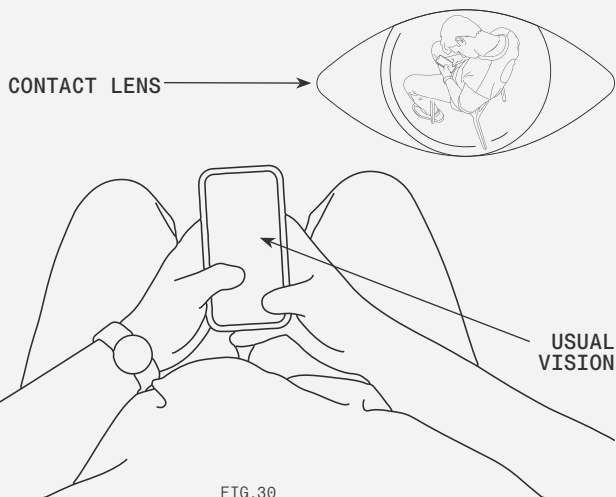

FIG.30

WHY IT WORKS

When we are inside a compulsive habit, self-awareness disappears. We do not see ourselves from the outside. We do not process what we are doing or in what context we are doing it.

The theory of objective self-awareness, formulated

by Duval and Wicklund in 1972, establishes that when a person becomes the object of their own attention, they activate self-evaluation processes that compare their current behavior against their internal standards. Seeing your own body in context – on the sofa, in the bathroom, in the middle of a meal – is not facial self-recognition: it is situational self-evaluation. The gap between how we perceive our own actions and how we actually carry them out becomes impossible to sustain.

In video game design, the third-person camera is not just an aesthetic choice: it changes the player's relationship with their own avatar and with the decisions they make. 3rd Person View transfers that principle to the physical world. It turns the user into an observer of their own behavior in real time, without editing and without escape.

ANATOMY OF THE OBJECT

3rd Person View has two components that work together.

The contact lens. The device that receives and projects the image directly into the user's field of vision. It does not occupy the entire field of view – it appears in a corner, as a persistent overlay that activates at random. Invisible to others. Only present for the person wearing it.

The external camera. A compact device integrated into clothing or an everyday accessory. It records continuously from a rear perspective, capturing the full body and surrounding environment. Its presence is discreet. It does not signal it is recording.

No sound. No text. No judgment. Just the image.

HOW TO USE IT

3rd Person View has no instructions for use in the conventional sense. There are no activation steps, no startup protocol. What follows is a description of what happens.

FIG.31

STEP 1 WEAR THE SYSTEM

Put in the contact lens and integrate the camera into the clothing you are wearing that day. From that point, the system operates on its own. There is nothing else to do.

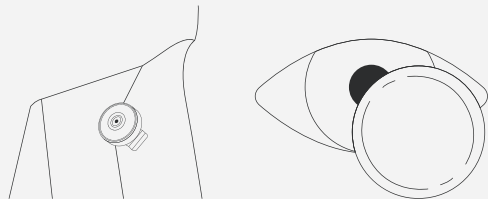

FIG.32

STEP 2 LIVE NORMALLY

Do what you were going to do. Use your phone, talk to someone, eat, work. 3rd Person View does not interfere with any activity. It operates in the background with no visible signal that it is active.

FIG.33

STEP 3 THE IMAGE APPEARS

At some point – you do not know when – an image appears in a corner of your field of vision: you, from behind, full body, in the exact context you are in at that instant. What you see is not a reconstruction. It is what is happening right now.

FIG.34

That moment is 3rd Person View.

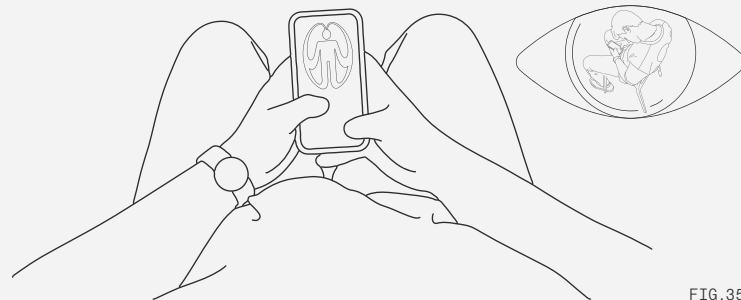

FIG.35

STEP 4 THE IMAGE DISAPPEARS

You cannot close it. You cannot extend it. It goes on its own. It leaves no trace, generates no record, accumulates nothing. The only thing that remains is what you did with that instant.

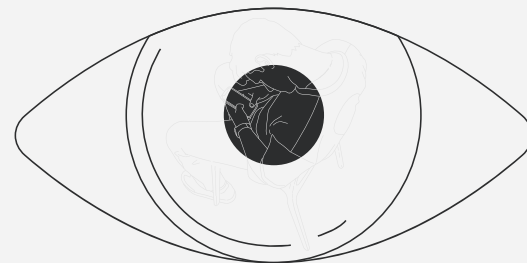

FIG.36

STEP 5 CONTINUE

You can go back to exactly what you were doing. 3rd Person View does not make decisions for you. It has only managed to make you present, for a moment.

FIG.37

WHEN TO USE IT

Always. 3rd Person View makes no distinction between contexts or times of day. It operates in any situation where you are wearing the system: at home, on the street, on public transport, at a meal. The randomness of the interval is part of the design – if you knew when it was going to appear, you would prepare yourself to ignore it.

Its power lies precisely in the moments you least expect: when you have been on your phone for twenty minutes without having decided to, when you are using it in the middle of a conversation, when you are somewhere you know you should not be looking at the screen. These are the moments when self-observation stings a little more. And that is exactly its purpose.

WHAT 3rd PERSON VIEW DOESN'T DO

3rd Person View doesn't stop you from using your phone.

IT DOESN'T
BLOCK YOUR
APPS.

IT DOESN'T
TRACK YOUR
SCREEN
TIME.

IT DOESN'T
GUILT TRIP
YOU.

IT DOESN'T
JUDGE YOU.

It does not build a profile. Each interruption is independent of the last.

Nor does it make decisions for you. Picking up the phone out of habit, scrolling without purpose, ignoring someone who is talking to you. All of those gestures still happen. But you watch yourself carrying them out from the outside. What you do with that is yours.

3rd Person View doesn't save you.
It watches you.

CURRENT LIMITATION

3rd Person View is the most speculative proposal in the project. The technology it imagines – a persistent visual

overlay in the field of vision delivered through a contact lens – sits at the intersection between current augmented reality glasses and what those technologies will become in the coming years.

Devices like Apple Vision Pro and the next generations of AR glasses in development are pointing exactly in that direction. This proposal is not for today. It is for when the technology gets where it is already heading – and a question about what design decisions will be made when that moment arrives.

*How would you act if you could see yourself
at this exact moment?*

Playing or being played
